CS3063 Theory of Computing

Semester 4 (21 Intake), Jan – May 2024

Lecture 6

Context-Free Languages: Session 1

Announcements

Assignment 1: due 04th March

- Week 7: Quiz 5 (based on L6, this lecture)
 - Thursday 7th March
 - 8.15am: Group 1
 - 9.15am: Group 2

Today's Outline:

Lecture 6

Context-free Languages (CFLs) - 1

- Context-free Grammars (CFGs)
- Derivations
- CFL: Definition and Examples
- CFGs and Regular Languages
- Derivation Trees
- Ambiguity in CFGs

Today's Outline:

Lecture 6

Context-free Languages (CFLs) - 1

- Context-free Grammars (CFGs)
- Derivations
- CFL: Definition and Examples
- CFGs and Regular Languages
- Derivation Trees
- Ambiguity in CFGs

Context-free Grammars

- Definition: A context-free grammar (CFG) is a 4-tuple $G = (V, \Sigma, S, P)$ where V and Σ are disjoint finite sets, $S \in V$ and P is a finite set of formulas of the form $A \to \alpha$ where $A \in V$ and $\alpha \in (V \cup \Sigma)^*$
 - V is a set of variables or non-terminal symbols
 - $-\Sigma$ are terminal symbols or *terminals*
 - S is the start symbol
 - − *P* is the set of *grammar rules* or *productions*

Can we describe natural languages?

$$S \to \Lambda$$

 $S \rightarrow Sa$

 $S \rightarrow Sb$

Non-terminal: S

Terminals: Λ,a, b

Use symbol "|" to mean "or"

$$S \rightarrow \Lambda \mid Sa \mid Sb$$

• Write " $\alpha \Rightarrow \beta$ " to mean β can be obtained by applying one of the rules to α

$$S \Rightarrow Sa \Rightarrow Sba \Rightarrow Sbba \Rightarrow \Lambda bba = bba$$

Derivations

- CFGs generally contain recursive definitions; we obtain (or derive) strings by applying productions
- To indicate a derivation is w.r.t a CFG, G, we write " $\alpha \Rightarrow_G$ " (generally, " $\alpha \Rightarrow \beta$ ")
 - This means string β can be obtained from string α by replacing some non-terminal on the LHS of a production in G
 - That is: $\alpha = \alpha_1 A \alpha_2$, $\beta = \alpha_1 \theta \alpha_2$ since $A \rightarrow \theta$ in G

Derivations ...contd

• With " $\alpha \Rightarrow_G \beta$ " (or, " $\alpha \Rightarrow \beta$ ") we say α derives β , or β is derived from α , in one step

• We write " $\alpha \Rightarrow_G^* \beta$ " (or, " $\alpha \Rightarrow_G^* \beta$ ") if α derives β in zero or more steps

Derivations ...contd

- Suppose at some point in a derivation we have obtained a string $\alpha = \alpha_1 A \alpha_2$ containing the non-terminal A
- Suppose we have the production A→θ

 We may continue by substituting θ for A, independent of the context (~ context-free) which means no matter what α₁ and α₂ are

Today's Outline:

Lecture 6

Context-free Languages (CFLs) - 1

- Context-free Grammars (CFGs)
- Derivations
- CFL: Definition and Examples
- CFGs and Regular Languages
- Derivation Trees
- Ambiguity in CFGs

Context-free Languages

• Definition: Let $G = (V, \Sigma, S, P)$ be a CFG. The language generated by G is

$$L(G) = \{ x \in \Sigma^* | S \Longrightarrow_G^* x \}$$

• A language L is a context-free language (CFL) if there is a CFG G so that L = L(G).

• The language {*a*^{*n*}*b*^{*n*} | n≥ 0}

$$S \rightarrow \Lambda \mid aSb$$

- Whenever a is added to a string b is added simultaneously
 - Recall: this is not a regular language

- The language *pal* of palindromes over $\Sigma = \{a, b\}$
 - $-\Lambda$ is in *pal*
 - For any a in Σ , a is in *pal*
 - For any a in Σ and x in pal, axa is in pal
 - Nothing else can be in pal

The following CFG defines pal

 $S \rightarrow \Lambda \mid a \mid b \mid aSa \mid bSb$

- Language of simple arithmetic expressions
 - Consider only: +, -, *, /, (,) and identifier a

Can you write the set of productions?

$$S \rightarrow S+S \mid S-S \mid S*S \mid S/S \mid (S) \mid a$$

- Syntax of programming languages
- Can you formulate grammar rules to specify a legal statement in C/Java/Python?

Properties of CFLs

• Theorem: If L_1 and L_2 are CFLs, then the languages L_1 U L_2 , L_1L_2 and L_1^* are also CFLs

Corollary: Every regular language is a CFL

Today's Outline:

Lecture 6

Context-free Languages (CFLs) - 1

- Context-free Grammars (CFGs)
- Derivations
- CFL: Definition and Examples
- CFGs and Regular Languages
- Derivation Trees
- Ambiguity in CFGs

CFG for a Regular Language

 Example: obtain a CFG equivalent to the regular language (011|1)*(01)*

```
A \to 011 \mid 1 (we get \{011, 1\})
B \to AB \mid \Lambda (we get \{011, 1\}^*)
D \to 01
C \to DC \mid \Lambda (we get \{01\}^*)
S \to BC (we get \{011, 1\}^* \{01\}^*)
($\int \text{is the start symbol})
```

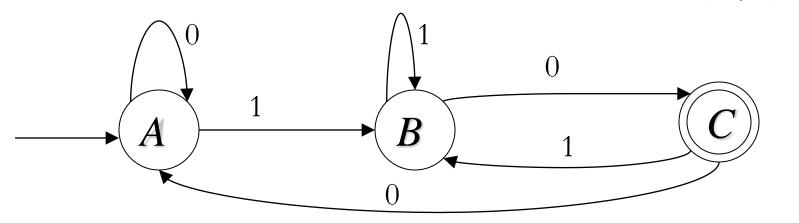

CFG from an **FA**

- Suppose we have an FA that accepts L
- We can get the CFG from the FA
 - Productions have a simple form (they track the transitions in the FA)
 - Reversible construction (can get the FA from the CFG)
 - Include productions of the form $P \rightarrow aQ$ where

$$P \xrightarrow{a} Q$$

is a transition in the FA

(0|1)*(10)

- A \rightarrow 1B, A \rightarrow 0A, B \rightarrow 1B, B \rightarrow 0C, C \rightarrow 0A, C \rightarrow 1B
- To terminate, add B → 0
 - General form $P \rightarrow a$ which says that the FA goes to an accepting state from P with input a

Regular Grammars

 A grammar G is regular if every production takes one of the two following forms:

$$B \rightarrow aC$$

$$B \rightarrow a$$

(B, C are non-terminals, a is a terminal)

Today's Outline:

Lecture 6

Context-free Languages (CFLs) - 1

- Context-free Grammars (CFGs)
- Derivations
- CFL: Definition and Examples
- CFGs and Regular Languages
- Derivation Trees
- Ambiguity in CFGs

Derivation Trees

- Given a CFG, interpreting a string correctly requires finding a correct derivation of the string in the grammar
- Structure of derivation can be shown by a derivation tree (or parse tree)
 - Root: non-terminal with which derivation starts
 - Internal nodes: non-terminals that appear in the derivation
 - Leaf nodes: terminals appearing in derivation

Given the grammar:

$$S \to S+S \mid S-S \mid S*S \mid S/S \mid (S) \mid a$$

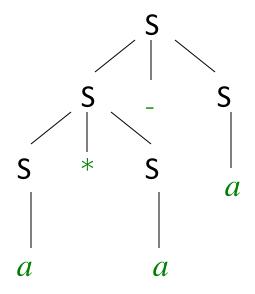

show derivation trees for

(i)
$$a * a - a$$

(ii)
$$a - a/a$$

Solution

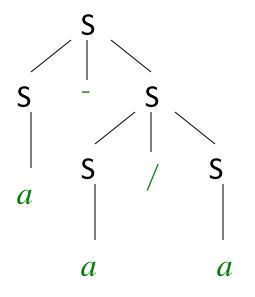

(i)
$$S \Rightarrow S - S \Rightarrow S^*S - S \Rightarrow a * S - S \Rightarrow a * a - S \Rightarrow a * a - a$$

The derived string is extracted from the derivation tree by a left-to-right scan of the leaves

Solution ...contd

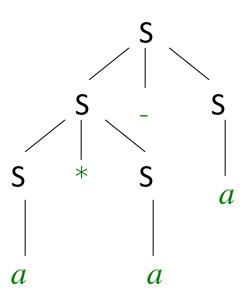

(ii)
$$S \Rightarrow S - S \Rightarrow S - S/S \Rightarrow a - S/S \Rightarrow a - a/S \Rightarrow a - a/a$$

Derivation Trees ...conto

- Consider the derivation tree for a * a a
 - What derivation corresponds to it?
 - Is there only one derivation?
- Generally speaking
 - A derivation tree can correspond to more than one derivation
 - Yet a derivation tree has only one leftmost derivation (and vice versa)

(i.e., a 1-to-1 correspondence)

Derivation Trees ...contd

- Leftmost derivation
 - Always replace the leftmost non-terminal
- Rightmost derivation
 - Always replace the rightmost non-terminal
- Exercise
 - Given the CFG S \rightarrow S+S | S S | S*S | S/S | (S) | a and the derivation tree in last slide (for the string a * a a), show the leftmost, rightmost and another derivation.

Derivation Trees ...contd

- Derivation trees
 - specifies productions used
 - temporal order not specified
- Leftmost derivations corresponding to different derivation trees are different
- A string of terminals has more than one derivation tree iff it has more than one leftmost derivation
 - [Same for rightmost, symmetrically]

Today's Outline:

Lecture 6

Context-free Languages (CFLs) - 1

- Context-free Grammars (CFGs)
- Derivations
- CFL: Definition and Examples
- CFGs and Regular Languages
- Derivation Trees
- Ambiguity in CFGs

Ambiguity

Definitions

 A string of terminals is said to be ambiguous (or ambiguously derived) if it has more than one derivation tree

 A CFG, G, is ambiguous if there is at least one string in L(G) having two or more derivation trees

Ambiguity ...conto

- Ambiguity in natural languages?
- Can you give an example?
 - "They are flying airplanes"
 - "Disabled fly to see the President"
 - S → <collective_noun><verb>...
 - S → <adjective><noun> ...

Ambiguity ...conto

Given the grammar:

$$S \to S+S \mid S-S \mid S*S \mid S/S \mid (S) \mid a$$

string "a+a-a" has two leftmost derivations:

(i)
$$S \Rightarrow S+S \Rightarrow a+S \Rightarrow a+S-S \Rightarrow a+a-S \Rightarrow a+a-a$$

(ii)
$$S \Rightarrow S-S \Rightarrow S+S-S \Rightarrow a+S-S \Rightarrow a+a-S \Rightarrow a+a-a$$

Can you draw the derivation trees?

Ambiguity ...contd

• The "Dangling Else" ambiguity:

```
<stmt> \rightarrow if (<expr>) <stmt> | if (<expr>) <stmt> else <stmt> | <other_stmt>
```

Consider the statement:

```
if (expr1) if (expr2) f(); else g();
```

Give two different derivation trees for this

Ambiguity ...contd

Given statement:

```
if (expr1) if (expr2) f(); else g();
```

Two different derivations correspond to:

```
(i) if (expr1) { if (expr2) f(); } else g();(ii) if (expr1) { if (expr2) f(); else g(); }
```

 (ii) is used (imposing the rule: "else associates with the closest else-less if")

Unambiguous Grammars

Examples

$$S \rightarrow aSb \mid ab$$

$$\{a^nb^n \mid n \geq 1\}$$

$$S \rightarrow aSa \mid bSb \mid c$$

$$\{wcw^R \mid w \in \{a, b\}^*\}$$

Ambiguity ...conto

- Ambiguity comes from the grammar
 - (not really a property of the language)

 Given an ambiguous CFG, usually possible (and desirable) to find an equivalent unambiguous CFG

Suppose we have the ambiguous CFG:

$$S \rightarrow S + S \mid S * S \mid (S) \mid a$$

- Avoid S → S + S and S → S * S because these produce ambiguity
- Also possible to impose rules of order and operator precedence
- Homework: obtain an unambiguous CFG equivalent to the given ambiguous CFG

Conclusion

- We started new topic: CFGs and CFLs
 - Basics of CFGs, CFLs
 - Regular grammars
 - Derivations
 - Ambiguity
